

Project Title

Food Delivery Analysis using Tableau

Project Description

This project focuses on analyzing food delivery data using Tableau to uncover valuable business insights. Interactive dashboards were developed to visualize customer ordering patterns, revenue trends, delivery performance, cuisine preferences, and city-wise order distribution. The project enables users to explore data through filters and story points, supporting data-driven decision-making for food delivery businesses.

Problem Statement

Food delivery companies generate large amounts of operational data, making it difficult to identify customer preferences, revenue opportunities, and delivery trends through raw records alone. The objective of this project is to transform the data into interactive visualizations that help stakeholders quickly understand business performance and make informed decisions.

Objectives

1. Analyze food delivery data using Tableau.
2. Identify customer ordering patterns.
3. Analyze revenue across different meal types.
4. Evaluate delivery performance.
5. Compare order distribution across cities.
6. Present insights through interactive dashboards and stories.

Dataset Information

- A. **Dataset Name:** Food Delivery Analysis Dataset
- B. **Records:** 50,000
- C. **Attributes:** 19

The dataset contains customer food ordering information including city, cuisine, meal type, order value, delivery time, customer rating, company type, and other attributes used for analysis.

Tools & Technologies

- Tableau Public 2026.2
- Tableau Desktop
- Microsoft Excel / CSV Dataset
- Flask (Web Integration)
- GitHub (Project Repository)

Methodology

1. Data Collection
2. Data Cleaning
3. Data Preparation
4. Data Import into Tableau
5. Dashboard Development
6. Story Creation
7. Performance Testing
8. Web Integration using Flask
9. Publishing to Tableau Public

Dashboards and Story

Food Delivery Analysis Dashboard

The dashboard presents key business metrics and interactive visualizations related to food delivery operations. It allows users to explore customer ordering behavior, revenue trends, delivery performance, and cuisine preferences through filters and interactive charts.

Story Developed

A Tableau Story was created to present the analysis in a structured manner through the following five story points:

- Business Overview
- Revenue Analysis
- Delivery Performance

- Customer Ordering Pattern
- Final Business Insights

Each story point highlights a different aspect of the analysis, enabling users to navigate through the insights in a logical sequence.

Key Business Insights

- Customer ordering behaviour varies across meal types and cities.
- Certain cuisines generate higher demand than others.
- Revenue distribution differs significantly among meal categories.
- Delivery performance varies across different regions.
- Interactive filters improve data exploration and business decision-making

Results

The project successfully transformed raw food delivery data into interactive Tableau dashboards and stories. The dashboards provide meaningful insights into customer behaviour, revenue trends, delivery performance, and cuisine preferences. The published Tableau Public story and Flask-based web integration make the project accessible through a web browser.

Conclusion

The Food Delivery Analysis project demonstrates how Tableau can be used to convert raw business data into interactive visualizations that support analytical decision-making. By combining dashboards, stories, performance validation, and web integration, the project provides an effective solution for exploring food delivery trends and business performance.
