

Ideation Phase

Brainstorm & Idea Prioritization Template

Date	13 July 2026
Team ID	
Project Name	Food Delivery Analysis using Tableau
Maximum Marks	4 Marks

Brainstorm & Idea Prioritization Template:

Brainstorming provided a free and open environment that encouraged every member of the team to participate in the creative-thinking process leading to problem solving for the project, Food Ordering Behaviour and Customer Trends. Prioritising volume over value, out-of-the-box ideas were welcomed and built upon, and all participants collaborated to develop a rich set of analytical and design ideas.

This document records how the team used a structured brainstorming and prioritization process to move from an open problem space to a focused, feasible project plan, even while coordinating across individual schedules.

Step-1: Team Gathering, Collaboration and Select the Problem Statement

The project was initiated by identifying a suitable business problem related to food delivery data analysis. After studying the available dataset, the project scope was defined to focus on customer ordering behaviour, revenue analysis, cuisine preferences, and delivery performance. A structured plan was prepared to design interactive Tableau dashboards, develop a Tableau Story, publish the project on Tableau Public, and integrate the dashboard into a Flask web application.

PROBLEM STATEMENT

How might we analyze food delivery data to identify customer ordering patterns, revenue trends, cuisine preferences, and delivery performance so that businesses can make informed decisions using interactive business intelligence dashboards?

Key Rules of Brainstorming Followed

✓ Stay on topic Keep every idea tied to the problem statement on food ordering behaviour.	✓ Encourage wild ideas Unconventional analytical angles were welcomed before being filtered.
✓ Defer judgment No idea was rejected during the listing stage; evaluation came later, in Step-3.	✓ Listen to others Each member reviewed and built upon ideas shared by teammates.

✓ **Go for volume**

The goal in Step-2 was quantity of ideas, not immediate quality.

✓ **Be visual**

Ideas were grouped and plotted visually to aid shared understanding.

Step-2: Brainstorm, Idea Listing and Grouping

Individual Idea Listing (Sticky-Note Stage)

Individual Ideas
Collect and understand the food delivery dataset.
Clean and prepare the dataset for visualization.
Create calculated fields for meaningful analysis.
Design an interactive Tableau dashboard.
Build KPI cards for business metrics.
Create charts to analyze revenue, cuisines, meal types, customer ratings, and delivery performance.
Develop a Tableau Story consisting of five story points.
Publish the dashboard on Tableau Public.
Integrate the published dashboard into a Flask web application.
Upload the complete project to GitHub.

Grouped Ideas (Thematic Clusters)

Once individual ideas were shared, similar and related ideas were clustered into themes, and each cluster was given a short label reflecting its focus area.

Cluster A — Data Preparation

- Dataset understanding
- Data cleaning
- Calculated fields
- Data validation

Cluster B — Dashboard Development

- KPI Cards
- Revenue Analysis
- Customer Rating Analysis
- Cuisine Analysis
- Meal Type Analysis
- Delivery Performance
- Interactive Filters

Cluster C — Story Development

- Business Overview
- Revenue Analysis
- Delivery Performance
- Customer Ordering Pattern
- Final Business Insights

Cluster D — Deployment

- Tableau Public Publishing
- Flask Web Integration
- GitHub Repository
- Project Documentation

Step-3: Idea Prioritization

With the clustered ideas in hand, the team plotted each idea on an Importance-versus-Feasibility grid to agree on what mattered most and what was realistically achievable within the project timeline and available dataset.

Prioritization Summary

Do First	Dashboard Development, Data Cleaning, Interactive Visualizations
Plan Next	Additional Predictive Analytics and Machine Learning Features
Fill-in Tasks	GitHub Documentation, Flask Integration, Project Report
Reconsider	Advanced Forecasting and Recommendation System

The highest priority was given to preparing the dataset, designing the Tableau dashboard, and creating interactive visualizations that provide meaningful business insights. After completing the dashboard, a Tableau Story was developed to present the analysis in a structured manner. The project was then published on Tableau Public, integrated into a Flask web application, and documented using GitHub. Future enhancements may include predictive analytics and machine learning models for demand forecasting.
