Project: Food Delivery Analysis using Tableau

PS-1

I am: Restaurant Manager

I'm trying to: Monitor customer ordering behaviour, identify popular cuisines, analyze revenue trends, and evaluate delivery performance to improve business operations.

But: The food delivery data is stored in a large dataset, making it difficult to identify patterns and insights through manual analysis.

Because: There is no interactive dashboard that provides a centralized view of key business metrics such as customer preferences, meal types, revenue, and delivery performance.

Which makes me feel : Frustrated because important business decisions become slower and less effective without clear data visualization.

PS-2

I am: Business Analyst

I'm trying to : Analyze customer ordering patterns, revenue contribution, cuisine preferences, and city-wise delivery performance using interactive visualizations.

But : The dataset contains thousands of records, making manual analysis time-consuming and difficult to interpret accurately.

Because : Without business intelligence tools, it is challenging to identify meaningful trends, compare performance, and generate actionable insights.

Which makes me feel: Inefficient because valuable business opportunities and data-driven decisions may be missed.

Problem to Solution Flow

Raw Food Delivery Dataset ->Data Cleaning & Preparation->Interactive Tableau Dashboard ->Tableau Story (5 Story Points)->Business Insights & Performance ->Analysis->Tableau Public Publishing->Flask Web Integration->Better Business Decision Making
